RE: Traffic Impact Analysis & Distribution

1962 Real Estate LLC
40 Wakefield Street
Rochester, NH 03866

John & Linda Svenson
P.O. Box 10
Barrington, NH 03825

Mr. Hewitt,

On behalf of the applicants, 1962 Real Estate LLC and John & Linda Svenson, Berry Surveying & Engineering (BS&E) is submitting for your review a Traffic Impact Analysis, for the reestablishment of Christmas Lane. This will serve to better assist the existing homes, including the Christmas Dove and the proposed 2,500 Sq. Ft. bank (Holy Rosary Credit Union) with a drive through.

The following conclusions were reached as a result Traffic Impact Analysis:

- A total of 33 vehicle trips (21 enter/12 exit) is predicted to occur at the AM peak hour and 95 vehicle trips (46 enter/49 exit) at the PM peak hour.
- This is an increase in trip generation of 30 AM trips, 61 PM trips, and 370 weekday trips.
- The 2018 and 2028 build traffic volumes DO NOT satisfy the NCHRP 457 guidelines for the implementation of a right-turn lane.
- The 2018 and 2028 build traffic volumes DO NOT satisfy the NCHRP 457 guidelines for the implementation of a left-turn lane.
- It is recommended that the existing and surrounding infrastructure will be sufficient to handle the projected increase in vehicle trips and peak hour and all other hours.

2018-005 1962 Real Estate LLC, John & Linda Svenson, Barrington, NH
Traffic Impact Analysis, Rev.: July 20th, 2018

Proposed Development & Introduction

The proposal is to re-develop Christmas Lane for better access to NH 9 for the existing houses, the Christmas Dove and the proposed Holy Rosary Credit Union. The purpose of this analysis is to determine the maximum number of trips coming to and leaving Christmas Lane during certain peak periods of the day. This information is then used in determining the impact on safety as it relates to the existing roadway infrastructure. The following components of the analysis are typical for a project of this size pursuant to the Institute of Traffic Engineers (ITE) manual.

Existing Conditions

Existing Site Description

The existing site consists of two lots, Tax Map 239, Lot 2 and Tax Map 235, Lot 1. These parcels contain 114,280 Sq. Ft. (2.62 Ac.) and 706,280 Sq. Ft. (16.21 Ac.) of land, respectively. The site is combination of wooded and open land, and currently on site are three single family detached homes and the “Christmas Dove”, a specialty retail store. The site is located in the town center zone, and is surrounded by other commercial and residential lots. There is a commercial driveway approximately 250 feet to the east of the existing driveway cut, the “Village Barn”, and a residential driveway across from the site.

NH Route 9 Road Description

NH Route 9 is a two lane major collector road, according to the NHDOT MS2 Transportation Management System (NHDOT). This road provides access to NH Route 125 and the Barrington town center to the east and more rural parts of Barrington to the west. It has an Average Annual Daily Traffic (AADT) of approximately 6,355 (2017) divided between east and west, also as shown by the NHDOT.

NH Route 9 in the area of the project is composed of a twenty-seven foot wide paved surface with a variable shoulder widths on the north and south side of the road. There is a centerline delineation and fog / edge lines provided. The posted speed limit of the roadway is 30 miles per hour (MPH). The geometry of NH Route 9 in the project area is situated on a curve, and is super elevated to the south. The proposed driveway is on the apex of the curve to maximize sight distance. There are no existing sidewalks, crosswalks, or other pedestrian amenities in the area of the project.

Existing Traffic Volumes

According to traffic counts recorded by the NHDOT for July 1st 2016, the NH Route 9 AM and PM two-way peaks were 568 trips and 821 trips, respectively. It was found that NH Route 9 has an AADT of 6,355 vehicles.

2018-005 1962 Real Estate LLC, John & Linda Svenson, Barrington, NH
 Traffic Impact Analysis, Rev.: July 20th, 2018

The highest peak hour traffic volume on this section of NH Route 9 east bound occurred from 7-8 AM with 398 vehicles and from 4-5 PM with 235 vehicles. West bound highest peak hour traffic volume occurred from 7-8 AM with 208 vehicles and from 4-5 PM with 586 vehicles. Table #1 shows the traffic direction breakdown of NH Route 9 and Figures #1-3 are graphical representations of the traffic variations occurring throughout the day.

| Traffic Distribution NH Route 9 | | | | |
|---------------------------------|------------|------|------------|------|
| Date | East Bound | | West Bound | |
| 7/1/2016 | AM Peak | 398 | AM Peak | 208 |
| | PM Peak | 235 | PM Peak | 586 |
| % Distribution | AM Peak | 65.7 | AM Peak | 34.3 |
| | PM Peak | 28.6 | PM Peak | 71.4 |

www.BerrySurveying.Com

Existing Vehicle Speeds

As previously mentioned, the posted speed limit of NH Route 9 is 30 MPH. For the purposes of the safety analysis below, the 85th percentile of speed is required. This particular section of NH Route 9 was observed by Berry Surveying & Engineering to analyze the pass by traffic, reviewing speed. Excessive speeds were rare, and most operators obeyed the posted speed limits within a deviation of 5 MPH. This is consistent with speeds found on urban roads. The 85th percentile derived by observation and consistency with general practice is 35 MPH.

Intersection of NH Route 9 and NH Route 125

Approximately 0.1 miles to the east, NH Route 9 connects to NH Route 125 at an angle of 90 degrees, where a signalized intersection is used to control traffic movements. NH Route 125 has a posted speed limit of 35 MPH and is considered a principal arterial road according to the NHDOT. NH Route 125 consists of three north bound lanes (left, through, through + right) and three south bound lanes (left, through, through + right) in the area of the intersection of NH Route 9 and NH Route 125, with an Average Annual Daily Traffic (AADT) of 16,561 (2017) divided between north and south. The directional volume split is nearly 50/50, with a north bound AADT of 8,157 (2017) and south bound AADT of 8,404 (2017) and shows an increase in the PM peak hour traffic volumes proportional to what NH Route 9 experiences.

The directional breakdown of trips entering and exiting the site has taken into account the potential draw from NH Route 125. As NH Route 125 is a principal arterial road, this intersection will influence the trips to and from the site. Turn movements must be evaluated differently than the typical directional breakdown that would be derived strictly from the pass by traffic of NH Route 9. The ratio of AADT's from NH Route 9 and NH Route 125 was used to account for this. As trips enter and exit the project site to and from NH Route 125, entrance trips will influence the NH Route 9 west bound volume and exit trips will influence the NH Route 9 east bound volume. Table 2 shows a summary of AADT values for NH Route 9 and NH Route 125.

| | |
|-------------------|---------------|
| NH Route 125 AADT | 16,561 (2017) |
| NH Route 9 AADT | 6,355 (2017) |
| Combined AADT | 22,916 (2017) |

Table 2: AADT values for NH Route 9 and NH Route 125

These AADT's were then applied to determine what percentage of vehicles would potentially enter or exit to the east or west of the site. It was determined that 72.3% of vehicles would enter from NH Route 9 west bound, coming from the intersection of NH Route 9 and NH Route 125, and 27.7% would enter from NH Route 9 east bound. It was then determined that 72.3% of vehicles would exit to NH Route 9 east bound, going to the intersection of NH Route 9 and NH Route 125, and 27.7% of vehicles would exit to NH Route 9 west bound. This directional break

2018-005 1962 Real Estate LLC, John & Linda Svenson, Barrington, NH
 Traffic Impact Analysis, Rev.: July 20th, 2018

down is used later in the document in the determination of turning movements and turn bay warrant analyses. In addition, Figure 4 shows the configuration of the intersection of NH Route 9 and NH Route 125 with surrounding roadways, including AADT values (NHDOT).

Figure 4: Figure of the intersection of NH Route 9 and NH Route 125 with AADT values (NHDOT)

Existing Trip Generation

The 9th Edition ITE Trip Generation Manual was used to determine the existing volume of trips, as well as the percentage of entrance-to-exit traffic experienced during the AM & PM peak hours between 7 and 9 AM and 4 and 6 PM. Land Use Codes Single Family Detached Housing (210) and Specialty Retail Center (826) were used in deriving the trip generation for the existing site. Tables 2-4 provide average trip rate, total trips generated, enter to exit ratio, and the enter to exit distribution. Given the extremely seasonal draw the Christmas Dove has, it is anticipated that the ITE generation rates given for this use, on this site, will generate a conservatively high volume of traffic for most times of the year. BS&E has witnessed far less traffic than stated below in the PM peak hour.

Table 8: Changes in trip generation

Build Traffic Projections and Turning Analysis

Traffic data obtained from the NH DOT’s Transportation Data Management System has been projected to 2018 and ten years further to 2028. This has been done using a peak seasonal adjustment factor of 1.08 (AM & PM) and using an annual growth rate of 1%, compounded annually. The derivation of the peak seasonal adjustment factor comes from an average series of values from other urban highways from across New Hampshire, which can be found as Table 15 in Appendix D. Figures 5 and 6 show the build turning movements to and from the site. These figures also show the volume of traffic east bound and west bound on NH Route 9 in 2018 and the projected 2028 volumes.

Figure 5: 2018 build traffic volumes and turning movements

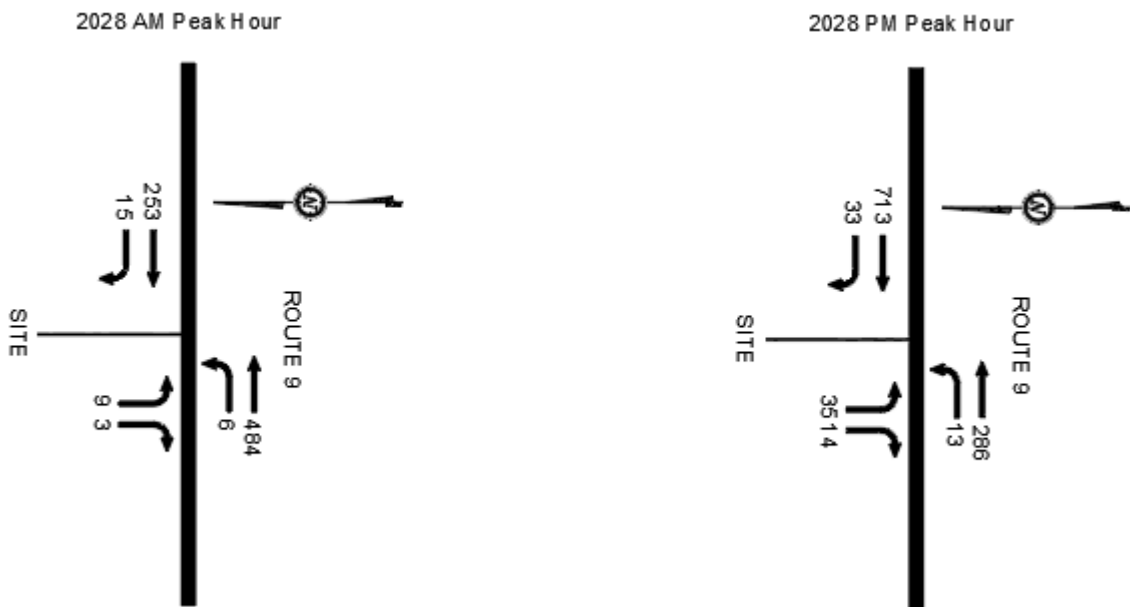

Figure 6: 2028 projected traffic volumes and turning movements

In Tables 9 and 10, the total trips that are calculated to occur from NH Route 9 are shown at AM and PM weekday peak hours. These are further broken down to entrance and exit into the site as well as percentage of left and right turns.

| Time | AM Peak Adj. Street Traffic | # Trips | Turn Type | % Distribution |
|-------------------------------------|-----------------------------|---------|-----------|----------------|
| Total Trips | 32.5 | | | |
| Trips Enter from Route 9 East Bound | | 5.7 | Left | 17.7 |
| Trips Enter from Route 9 West Bound | | 15.0 | Right | 46.2 |
| Trips Exit to Route 9 East Bound | | 8.5 | Left | 26.1 |
| Trips Exit to Route 9 West Bound | | 3.3 | Right | 10.0 |

Table 9: Summary of AM turning movements to and from the site

| Time | PM Peak Adj. Street Traffic | # Trips | Turn Type | % Distribution |
|-------------------------------------|-----------------------------|---------|-----------|----------------|
| Total Trips | 94.8 | | | |
| Trips Enter from Route 9 East Bound | | 12.8 | Left | 13.5 |
| Trips Enter from Route 9 West Bound | | 33.3 | Right | 35.2 |
| Trips Exit to Route 9 East Bound | | 35.2 | Left | 37.1 |
| Trips Exit to Route 9 West Bound | | 13.5 | Right | 14.2 |

Table 10: Summary of PM turning movements to and from the site

Left-Turn Warrants Analysis

Depending on vehicle speed, advancing vehicular volumes, opposing vehicular volumes, and the percent of left turns that vehicles are predicted to make, certain roadways may require special treatment for vehicles making left turning maneuvers. The determination of this special treatment is determined by the NCHRP 457 left turn bay guidelines. Calibration constants of 3.0 seconds are used for average left turn time, 5.0 seconds for critical headway, and 1.9 seconds for vehicles to clear the advancing lane. If warranted, the left turn bay would allow for deceleration of vehicles and storage in the queue to wait safely for advancing traffic to pass.

The AM and PM peak traffic volumes from 2016 projected to 2018 and 2028 were used to determine if a left-turn bay is warranted to safely enter the site. It has been calculated that approximately 6 trips are to occur turning left into the site during the AM peak hour and 13 during the PM peak hour. For 2018, the projected AM total advancing and total opposing volumes are 459 and 244, respectively. It was projected for 2028 that total advancing and total opposing volumes would be 505 and 268, respectively. For 2018, the projected PM advancing and opposing volumes are 305 and 679, respectively. It was projected for 2028 that advancing and opposing volumes would be 332 and 746, respectively. Using the 85th percentile speed of 35 MPH, it was determined that a left turn lane will not be warranted to safely enter the site. The projection of the traffic volumes for AM and PM peak hours is included as Figures 11 and 12. The full analysis can be found in Appendix B as Figures 13-16. Tables 11 and 12 are summaries of the left-turn bay analyses.

Table 12: Summary of PM NCHRP 457 left-turn bay analysis

Right-Turn Warrants Analysis

Depending on vehicle speed, advancing vehicular volumes, and the percent of right turns that vehicles are predicted to make, certain roadways may require special treatment for vehicles making right turning maneuvers. The determination of this special treatment is determined by the NCHRP 457 right turn bay guidelines. If warranted, the right turn bay would allow for deceleration of vehicles and storage in the queue to wait safely for right turning traffic to clear.

The AM and PM peak traffic volumes from 2016 projected to 2018 and 2028 were used to determine if a right-turn bay is warranted to safely enter the site. It has been calculated that approximately 14 trips are to occur turning right into the site during the AM peak hour and 34 for the PM peak hour. For 2018, the projected AM total advancing volume is 250 and PM total advancing volume is 692. It was projected for 2028 that the AM total advancing volume is 274 and the PM total advancing volume is 759. Using the 85th percentile speed of 35 MPH, it was determined that a right turn lane will not be warranted to safely enter the site. The projection of the traffic volumes for AM and PM peak hours is included as Figures 17 and 18. The full analysis can be found in Appendix B as Figures 19-22. Tables 13 and 14 are summaries of the right-turn bay analyses.

Table 14: Summary of PM NCHRP 457 right-turn bay analysis

Sight Distance and Safety Analysis

The proposed driveway is located at the apex of the road curve to maximize sight distance. Sight distance to the east and west, as well as driveway alignment are the two determining factors of safety. Sight distance to the east is un-obstructed for well over 400 feet (measured) while sight distance to the west is un-obstructed for well over 400 feet (measured.) Using Exhibit 3-1 (Stopping Sight Distance) (Figure 28) in the Geometric Design Manual, a 35 mph 85th percentile speed requires the stopping sight distance be 250 feet from the both directions. The standard sight distance required by NHDOT is 400 feet in cases where the Geometric Design Manual would not require more. In this instance both the easterly and westerly sight distances meet the design required warrant as well as the standard practice of NHDOT of 400 feet. There are no improvements required to maintain this site distance.

With respect to general safety of NH Route 9 in relation to the peak hour trip generation and AADT, it is our assessment that the cross section of pavement and shoulder widths are appropriate.

Conclusions and Recommendations

- 1.) A total of 33 vehicle trips (21 enter/12 exit) is predicted to occur at the AM peak hour and 95 vehicle trips (46 enter/49 exit) at the PM peak hour.
- 2.) This is an increase in trip generation of 30 AM trips, 61 PM trips, and 370 weekday trips.
- 3.) The 2018 and 2028 build traffic volumes DO NOT satisfy the NCHRP 457 guidelines for the implementation of a right-turn lane.
- 4.) The 2018 and 2028 build traffic volumes DO NOT satisfy the NCHRP 457 guidelines for the implementation of a left-turn lane.
- 5.) It is recommended that the existing and surrounding infrastructure will be sufficient to handle the projected increase in vehicle trips and peak hour and all other hours.

Respectfully Submitted,

AASHTO—Geometric Design of Highways and Streets

| Metric | | | | US Customary | | | |
|---------------------|-----------------------------|-------------------------------|-----------------------------|--------------|--------------------|------------------------------|--------------------------------|
| Design speed (km/h) | Brake reaction distance (m) | Braking distance on level (m) | Stopping sight distance (m) | | Design speed (mph) | Brake reaction distance (ft) | Braking distance on level (ft) |
| | | | Calculated | Design | | | |
| 20 | 13.9 | 4.6 | 18.5 | 20 | 15 | 55.1 | 21.6 |
| 30 | 20.9 | 10.3 | 31.2 | 35 | 20 | 73.5 | 38.4 |
| 40 | 27.8 | 18.4 | 46.2 | 50 | 25 | 91.9 | 60.0 |
| 50 | 34.8 | 28.7 | 63.5 | 65 | 30 | 110.3 | 86.4 |
| 60 | 41.7 | 41.3 | 83.0 | 85 | 35 | 128.6 | 117.6 |
| 70 | 48.7 | 56.2 | 104.9 | 105 | 40 | 147.0 | 153.6 |
| 80 | 55.6 | 73.4 | 129.0 | 130 | 45 | 165.4 | 194.4 |
| 90 | 62.6 | 92.9 | 155.5 | 160 | 50 | 183.8 | 240.0 |
| 100 | 69.5 | 114.7 | 184.2 | 185 | 55 | 202.1 | 290.3 |
| 110 | 76.5 | 138.8 | 215.3 | 220 | 60 | 220.5 | 345.5 |
| 120 | 83.4 | 165.2 | 248.6 | 250 | 65 | 238.9 | 405.5 |
| 130 | 90.4 | 193.8 | 284.2 | 285 | 70 | 257.3 | 470.3 |
| | | | | | 75 | 275.6 | 539.9 |
| | | | | | 80 | 294.0 | 614.3 |

Note: Brake reaction distance predicated on a time of 2.5 s; deceleration rate of 3.4 m/s² [11.2 ft/s²] used to determine calculated sight distance.

Exhibit 3-1. Stopping Sight Distance

Figure 28: Derivation of stopping sight distance requirements
