

**Shows existing road entrance that gets abandoned. New road access is re-located as approved. There are 6 +/- gravel parking spaces to the point of the existing gate that will be replaced with large stones. Walking trail begins after the large stones. Public has walking access only by foot to the so called fishing brook. I propose to lower the road making a walking trail. The existing slope conditions are shown on attachment #'s 2 & 3. Slopes are to be stabilized with 3/1 slopes, loam and seeding making the trail much safer to walk on. Doing this saves 150 truck trips each way, not requiring to truck material in. I am not agreeable to amending my plan, it is a **minor** logical change. If the board is not in agreement it can stay as is, which makes little sense. The change will be shown on the as built plans.**

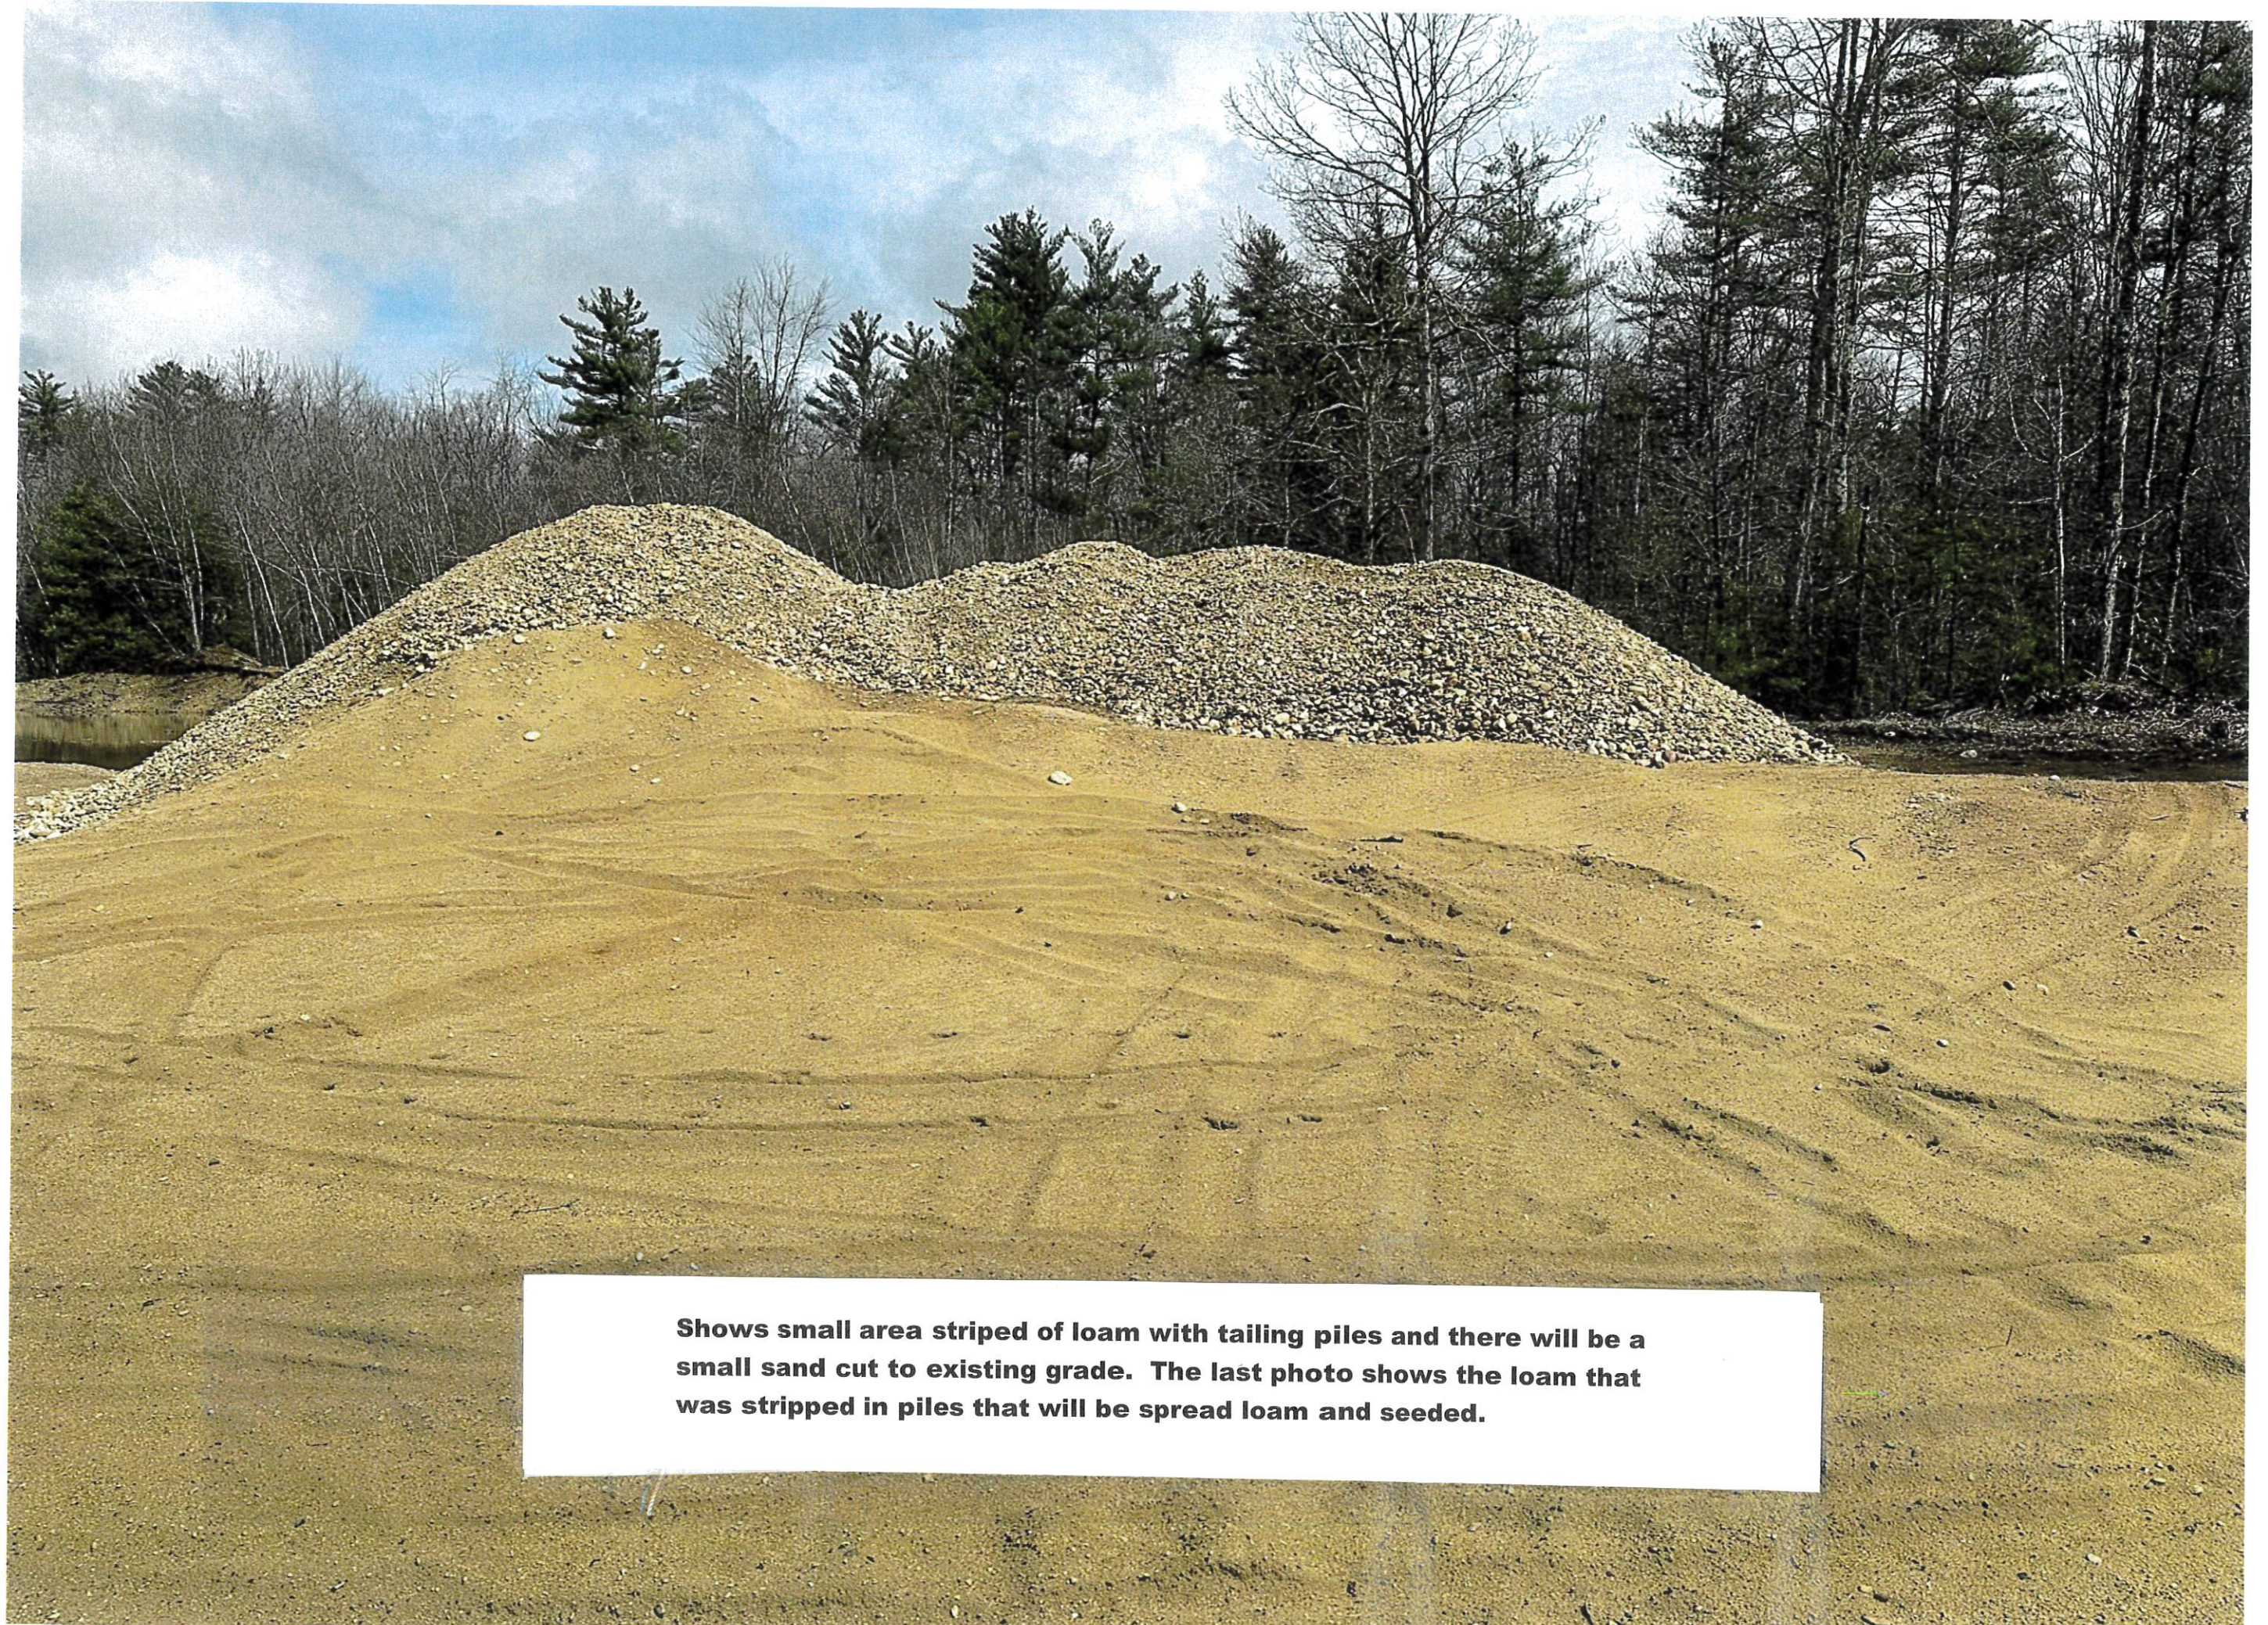

**Existing loam piles that were stripped from pit are located in multiple piles. Growth to be removed from piles where needed. To be used for reclaiming un-vegetated areas where developer disturbed and home sites.**

**Shows small area striped of loam with tailing piles and there will be a small sand cut to existing grade. The last photo shows the loam that was stripped in piles that will be spread loam and seeded.**
